Although digital type design is rooted in conventions inherited from punch-cutting, which is based on designing outlines, the history of typography is filled with experiments that seek to challenge this model.

Designed by Tanguy Vanlaeys, the typeface *Milling* emerges from the CNC-Type research project, initiated in 2017 at the Atelier National de Recherche Typographique (ANRT, Nancy), to explore the specific nature of single-line typefaces and their relationship to Computer Numerical Control (CNC) machining. Unlike traditional typefaces, which require outlines or filled shapes, single-line fonts are distinguished by their uniform lines with no variation in thickness or outline, allowing them to be engraved or cut out by CNC machines with greater speed and precision.

Milling is therefore adapted to numerical machining but in no way limited to this use alone.

The typeface comes in three styles: Simplex, Duplex, and Triplex, with each developed according to an approach centered on the path of the tool. Unlike traditional methods of type design, which involve “sculpting” letterforms, Tanguy Vanlaeys designed the paths that guide the tool’s movement.

For the Simplex style, the thickness of the letters results from a single pass of the machine. In the Duplex and Triplex styles, the initial line is traced side by side two or three times, which allows for increased thickness, added contrast, and optical adjustments.

These three styles are available in several formats: SL, CAD, OT, and TP.

The SL (Single Line) and **CAD** (Computer-Aided Design) formats are single-line files intended for CNC machines*.

The OT (OpenType) version is designed for more conventional desktop publishing (DTP) use. The addition of outlines to the glyphs — from 0 to 1 mm for the Simplex and Duplex styles, and up to 5 mm for the Triplex style — provides *Milling* with a range of weights (sometimes pushing the limits of legibility) and a unique design.

The TP (Toolpath) version is also suited for conventional use, displaying the toolpath as contours across three levels.

Milling manages to meet the specific requirements of machining while simultaneously offering graphic designers extensive freedom to experiment across various mediums, including printing, engraving, pen plotting, and even laser cutting.

*See the user guide included in the *Milling SL* and *Milling CAD* specimen

INTRODUCTION

OWNERSHIP AND LICENCE

A typeface is created by a designer whose art is to transform an original typographic artwork into a computer file or files. As a consequence a typeface is – as a work – protected by laws pertaining to intellectual property rights and – as software – can not be copied and/or installed without first acquiring a nominative licence.

In no way, shape or form may a typeface be transmitted to a third party or modified. The desired modifications in the context of the development of a visual identity, can only be effected by the designer himself and only after acquisition of a written authorisation from 205TF.

The user of a 205TF typeface must first acquire of a licence that is adapted to his needs (desktop, web, application/epub, TV/film/videos web).

A licence is nominative (a physical person or business) and is non-transferable. The licensee can not transmit the typeface files to other people or organisations, including but not limited to partners and/or subcontractors who must acquire a separate and distinct licence or licences. The full text of the licence and terms of use can be downloaded here: any person or entity found in breach of one or more terms of the licence may be prosecuted.

THE OPENTYPE FORMAT

The OpenType format is compatible with both Macintosh and Windows platforms. Based on Unicode encoding it can contain up to 65,000 signs* including a number of writing systems (Latin, Greek, Cyrillic, Hebrew, etc.) and numerous signs that allow users to create accurate and sleek typographic compositions (small capitals, aligned and oldstyle numerals, proportionals and tabulars, ligatures, alternative letters, etc.). The OpenType format is supported by a wide range of software. The dynamic functions are accessed differently depending on the software used.

*A Postscript or Truetype typeface can contain no more than 256 signs.

THE SINGLE-LINE FORMAT

Each single-line font has been tested on Macintosh and Windows, the most popular 2D applications (InDesign, Illustrator) for “SL” fonts and CAD/CAM software (Rhinoceros 3D*) for “CAD” fonts.

These fonts are not adapted for Office (Word, Excel, Power point).

*OpenType features such as stylistic-set are not accessible in these environments and kerning is not supported. Our “CAM” single-line fonts have reduced character-set.

ELEMENTARY PRINCIPLES OF USE

To buy ore By buying a typeface you support typeface designers who can dedicate the time necessary for the development of new typefaces (and you are of course enthusiastic at the idea of discovering and using them!)

Copy? By copying and illegally using typefaces, you jeopardise designers and kill their art. In the long term the result will be that you will only have Arial available to use in your compositions (and it would be well deserved!)

Test! 205TF makes test typefaces available. Before downloading them from www.205.tf you must first register. These test versions are not complete and can only be used in models/mock ups. Their use in a commercial context is strictly prohibited.

RESPONSIBILITY

205TF and the typeface designers represented by 205TF pay particular attention to the quality of the typographic design and the technical development of typefaces.

Each typeface has been tested on Macintosh and Windows, the most popular browsers (for webfonts) and on Adobe applications (InDesign, Illustrator, Photoshop) and Office (Word, Excel, Power point).

205TF can not guarantee their correct functioning when used with other operating system or software. 205TF can not be considered responsible for an eventual “crash” following the installation of a typeface obtained through the www.205.tf website.

SIZE GUIDE FOR CNC MACHINERY

This typeface is specifically designed for use with CNC machines.

During its development, the designer has correlated the glyph design with use sizes in points (pt) and tool sizes in millimetres (mm).

For example, if you have a milling cutter with a diameter of 2mm, according to the table below, we advise you to compose your text in 96pt font.

This combination avoids any distortion of the letters caused by the tool and ensures optimum rendering of the text.

You can also use a simple equation* to calculate the optimum text size for the tool diameters you have and vice versa.

The size guide below is valid for the following styles: Simplex 1mm, Duplex 1mm and Triplex 1mm.

R R R R R R

* (x)pt/48=(y)mm
or (y)mm×48=(x)pt

ex. 192(pt)/48=4(mm)

Provender Milling: Manufacture of Feeding Stuffs for Live Stock

16 PTS

The issue of integrating automated processes within different workstations is not raised solely by designers and workers, but also by those who manufacture and improve machines. The esthetic sense of the user of a machine is one thing, but it is still necessary for the machine to be set up to accommodate this sensibility. It is, incidentally, not surprising that, for the past ten years or so, several designers – from Katharina Mischer and Thomas Traxler and The Idea of a Tree (2008), to Francois Brument's What's Wind Drawing. (2010), the Unfold Design Studio's Electronic Artisan (2010), Markus Kayser and his Solar

The issue of integrating automated processes within different workstations is not raised solely by designers and workers, but also by those who manufacture and improve machines. The esthetic sense of the user of a machine is one thing, but it is still necessary for the machine to be set up to accommodate this sensibility. It is, incidentally, not surprising that, for the past ten years or so, several designers — from Katharina Mischer and Thomas Traxler and The Idea of a Tree (2008), to Francois Brument's What's Wind Drawing. (2010), the Unfold Design Studio's Electronic Artisan (2010), Markus Kayser and his Solar Sinter (2011), or Phil Cuttance and his mechanical Faceture machine (2012) — have set out to invent their own mechanical and or digital machine tools, suggesting, it just so happens, that esthetic and perceptive qualities are being insufficiently taken into account by current inventors of digitally controlled machines and robots. Fablabs and makerspaces are probably the most consummate manifestations of people's
